

Organizing the Data

During the meeting, one or two people who have experience with data were selected to compile and organize the data collected by the EBPP team in a way that can be utilized in the Data Gallery Walk process in Module 3. If you have been selected for this role, please review the Data Gallery Walk in Module 3.

The same data can be organized and presented in different ways to see different trends. Whenever presenting data, please present data points with comparison data points, such as comparing data points over time, comparing local data with regional or state data, or comparing data from two different geographic regions or systems.

It is suggested you organize the data by category or by the Risk and Protective Factor level (i.e. individual, family, community, etc.) to help 'chunk' you data into more manageable amounts for your team to analyze. Do your best to present data through visualizations, but at the least, try to highlight key variables that are organized into a quick visual. You may also want to consider presenting the same data in multiple ways if it helps illuminate important information in a different way. An option is the use of the Data Map tool. Utilizing geographic mapping is a great way to present data as well.
